Projects we support

DCBB's reforestation support in Baltimori, Peru

 1000 trees planted

With the support of DCBB, the local team in Baltimori, Peru, could nurse 1000 extra seedlings in the nursery, which they planted in the rainforest in the spring of 2024! Additionally, DCBB donated t-shirts that can be used by the workers in the nursery and on the field. In Baltimori, Peru, we're often not starting with a bare patch on the map but we're mainly talking about enrichment planting in a secondary forest (a forest where only a few tree species grow as survival technique). With enrichment planting, we are speeding up the introduction of species of trees that are useful for human needs, including endangered species. When trees are planted in a secondary forest, a broader range of biodiversity is introduced back into the landscape sooner. In practical terms, straight trails are created through the secondary forest and trees are planted all along those trails. Because of the shade provided by the pioneer trees' canopy, these enrichment strips only need to be weeded once or twice a year, savings in work compared to planting trees on a bare plot, where weed growth can require monthly maintenance clearing. How do we work? Seeds are first collected in the nearby forests. When the seeds have grown into little plants, the plants are stored safely. Then, they go through a process of hardening, so that they have a higher survival rate. Finally, when the time is right during the rainy season, the seedlings are planted in nature.

Care for communities
