Reforestation in Baltimori - Ex Maxi plot (Peru), 2024-2026

 392 trees planted

On a parcel known as Ex Maxi, spanning about 2.14 hectares, 22,964 trees were planted with the help of Go Forest clients. The land was previously deforested by its former owner for agricultural use, and was acquired by our technical partner in 2022. Reforestation efforts were largely carried out in 2024, with the last trees planted in early 2026, focusing specifically on the areas that had been cleared. This parcel features a high planting density and a strong presence of leguminous tree species, prized for their ability to produce nitrogen-rich organic matter, such as flemingia. Flemingia is a prolific producer of organic matter and mulch, and also contributes by fixing nitrogen, attracting pollinators with its flowers, and possibly even improving soil health through its anti-nematode properties. Ex Maxi also hosts a significant number of trees from the Calliandra genus, especially Calliandra angustifolia, known locally as bobinsana or qori sachá. This species is not only used medicinally in the Amazon, but is also valued by pollinators and serves as a useful tutor plant for supporting vine crops in agroforestry systems. In total, 13 different species have been planted on this parcel: Moena naranja, Cacao, Huasaí, Shihuahuaco, Huayo blanco, Metohuayo, Cinamillo, Tahuarí negro, Charichuelo, Chemicua, Copaiba, Aceituna tropical, and Flemingia.
