GOFOREST

14.50

tonnes of CO₂
absorbed during lifetime

At Move Any Mountain, the mountains are our home — and we believe that exploring them comes with a responsibility to protect them. Since 2025, we've been planting trees in mountain regions through Go Forest: one tree for every retreat participant, and enough trees to offset the CO₂ emissions of each mountain incentive or wedding we organise. It's our way of giving back to the places that inspire us, so future generations can keep climbing, skiing, and celebrating in nature's most breathtaking playgrounds.

— Michèle De Vetter, on behalf of the Move Any Mountain team

Projects we support

Sohan (Theux) project, Belgium 2025-2026

 40 trees planted

The Sohan project focuses on restoring forest resilience across three forest areas in Theux, where several stands have been weakened by fungal disease, aging trees and climate-related stress. Extreme weather events, particularly the heavy rains and floods of 2021 in the Vesdre Valley, further highlighted the vulnerability of local forest ecosystems and the need for proactive restoration. Across 6.84 hectares, 6460 trees will be planted in April 2026 season. The project brings together a balanced mix of oak, hornbeam, chestnut, rowan, hazel, larch and cedar. This diversity helps prevent the formation of single-species stands, reduces risks linked to pests and diseases, and strengthens overall biodiversity. Before planting, the plots will undergo targeted preparation, including soil work where needed and the sanitary felling of trees affected by fungal decline to prevent further spread. Appropriate protection measures will also be installed to ensure successful establishment of the young trees. With a deep respect for local resources, the estate is managed according to sustainable and responsible forestry principles, including thoughtful thinning practices that support long-term timber production while avoiding clearcutting. The forest will be managed under an irregular continuous cover system, ensuring permanent tree cover and encouraging natural regeneration. Furthermore, the project contributes to soil stabilization, the reinforcement of the regional ecological network, and the preservation of the scenic character of the Sohan valley, while offering habitat for local wildlife. It represents a concrete, climate-adapted approach to responsible forestry and long-term forest stewardship.

The Belgian-Armenian forest 2025

 50 trees planted

We are aiming to plant 50,000 trees which represent a forest of 16 hectares, but let’s try to surpass that number. The area we have selected is near Lake Sevan, in the province of Gegharkunik, close to the village of Tsaghkunk. The land which is well-oriented to the north has a total surface of 51 ha. The creation of this forest will contribute to improving the landscape in Armenia and will also be a testament to the strong bonds between Belgium and Armenia. At the same time, the creation of this forest will have a significant social impact as it will create more than 100 direct and indirect jobs which will improve the livelihoods of many families. The elevation near Tsaghkunk is high, ranging between 2000 and 2200 m. We can plant a few different species of trees and shrubs, like pine, oak, wild apple, and wild pear. The soil is good with more clay content than in Lori province. However, this makes digging a bit more difficult after rainy days. This is a new region for us, and we have hired people from local communities to plant. P.S. When contributing more than 2000 trees to this particular project, your company name will be featured on the field panel. P.S.2. A more specific polygon outlining the project boundaries will be uploaded soon.
