Projects we support

Agroforestry in the local villages, Western Usambara Mountains, Tanzania

 60 trees planted

As part of our ongoing efforts to maximize the impact of our initiatives, we have decided to allocate 50% of the funds for Tanzania to reforestation efforts with native tree species, while the remaining 50% is allocated to supporting agroforestry tree planting within the local communities' farms. Agroforestry integrates trees and shrubs into agricultural landscapes, promoting sustainable farming practices that increase crop yields, improve soil health, and provide additional income sources for local farmers. By supporting both reforestation and agroforestry, we ensure a comprehensive approach that addresses environmental sustainability, food security, and economic development within the community. In the rainy season of November 2024, our local team and the local people of Nkundei village planted 2,258 fruit trees in the individual-owned farms in the Nkundei community.

Le Roeulx project, Belgium

 100 trees planted

In this project in Le Roeulx we plant 12,000 trees during the first months of 2024, with the majority of the trees planted in March 2024. On the 5.5-hectare plot, we mainly plant lines of chestnuts, oaks, maples, and walnuts. It is important to execute this project because the area is a very agricultural one with little afforestation. We are planting a diverse forest to preserve wildlife habitats and support the ecological and environmental benefits of the forest. Details: - Altitude of 118 meters. - The soil is loamy with favorable natural drainage or loamy with poor natural drainage. - The composition of the previous stand: ash trees. - The follow-ups of the trees are planned for April 2024 and summer 2025.

Baclain project, Belgium 2024-2025

 2 trees planted

The Baclain project, located in the Parc Naturel des Deux Ourthes (Gouvvy, Belgium), focuses on the reforestation of a 2.5-hectare plot of fallow land previously used for coniferous plantations. The plot is surrounded by diverse-aged forests with mixed species and is very close to the Wez de Halleux stream. This rural area, rich in natural and agricultural landscapes, has soils conducive to forest growth, specifically loamy soils with favorable natural drainage. Scheduled for the season of 2024-2025, we introduce 7,650 new trees using a mixed planting approach. The species composition includes 34% Douglas fir, 33% larch, 20% beech, 10% oak, and 3% chestnut, with spacing tailored to each species' needs. Ground preparation will involve band tillage, with residual vegetation mulched and wildlife deterrents applied to protect young saplings. The regeneration of native species such as birch, sorb, and oak is anticipated, complementing the planted trees. This balanced approach will promote a resilient forest structure that aligns with regional biodiversity and climate goals. In general, the project aims to restore the land's ecological and economic value by reestablishing forest cover and enhancing ecosystem services such as water quality, flood mitigation, soil protection, and carbon sequestration. It transforms neglected land into a thriving forest ecosystem, contributing to local environmental, social, and economic benefits. Plantation update: - 7650 trees were planted in March-April 2025: 2601 Douglas firs (34%), 2525 larches (33%), 1530 beeches (20%), 765 oaks (10%) and 229 chestnuts (3%). - Monitoring summary: The plantation took place on 2.5 hectares across several parcels in Gouvvy. The terrain was prepared in advance and treated with natural forest latex. Douglas and larches were planted in mixed rows (2x1.7m), while beeches and oaks were placed along the borders (2x1.5m). A field visit in June 2026 showed a good establishment of the trees, along with natural regeneration of birch & rowan. - Maintenance: Clearing will be necessary due to the abundance of ferns.

Amblève project, Belgium 2024-2025

 2 trees planted

The Amblève project, located in the commune of Amblève (BE 4770) and in the Amblève bassin, involves a reforestation initiative in response to an ongoing bark beetle infestation affecting the region's spruce forests. Rather than clear-cutting the entire area, selective extraction of infested trees is being implemented. This method varies depending on the situation, with some areas undergoing large or small-scale clear-cutting while others focus on isolated spruce removal. Following last season's intervention with 10,500 trees, another 14,280 trees are planted during the season of 2024-2025, in a mix of 1.5m x 1.5m (islands) or 2m x 2.5m spacing (in larger areas). The replanting will prioritize beech trees (88%) due to their adaptability to low-light conditions, particularly in small clusters. Other species, including hornbeam, linden, and maple, will be introduced in varying proportions, depending on the specific site conditions. There is significant wildlife pressure, but not enough to threaten the plantations. The manager plans to protect the planting clusters with small localized fences. The restoration effort aims to restore forest cover, enhance species diversity, and strengthen the forest's resilience to climate change. The project can be expanded up to 100,000 trees. The area, known for its rich rural and agricultural landscape, attracts hikers, cyclists, and horse riders exploring the extensive forests around the Amblève River. Historically, the region's forests were damaged during World War II, particularly during the Ardennes Offensive, and were subsequently replanted with spruce, which has proven vulnerable to pests and storms. The project is integrated into a special zone (ZIP), is easy accessible, and offers opportunities for site visits. Plantation updates: - Planting period: The plantation took place between November 2024 and February 2025. - 14280 trees planted: 11480 beeches, 1200 hornbeams, 1200 maples and 400 lindens. - Monitoring summary: The planting was carried out over 15.64 hectares of former spruce forest. Despite regular snow and freezing conditions, the weather did not hinder the work. Trees were planted in clusters, either under existing spruce stands or following clear-cutting. The terrain was prepared beforehand, and protection measures were applied where needed. No major difficulties were encountered.
